

City of Bucyrus Water Consumer Confidence Report 2017

Overview

The City of Bucyrus is pleased to present its Water Quality Report for the year 2017. This report is designed to inform you about the quality of your water. Included are details about where your water comes from, what it contains, and how it compares to federal and state EPA standards. We have a current and unconditional license to operate our water system.

Where Does My Drinking Water Come From?

The source of drinking water for the City of Bucyrus is surface water provided by two upground reservoirs. The Outhwaite, located on St. Rt. 98 N, has a 1 Billion Gallon capacity and the Riley, located on Kiess Road just south of St. Rt. 98, has a 180 Million Gallon capacity. As water levels in the reservoirs are depleted through usage, water from the Sandusky River is pumped into them at periodic intervals. In Ohio all surface waters are considered to be susceptible to contamination. By their nature surface waters are readily accessible and can be contaminated by chemicals and pathogens which may rapidly arrive at the public water intake with little warning or time to prepare. The City of Bucyrus' drinking water source protection area contains potential contaminant sources such as agriculture, a hazardous waste landfill, new home construction, junk yards, roadways and railways.

The City of Bucyrus public water system treats the water to meet drinking water quality standards, but no single treatment technique can address all potential contaminants. The potential for water quality impacts can be further decreased by implementing measures to protect the Sandusky River. More detailed information is provided in the City of Bucyrus' Drinking Water Source Assessment report, which can be obtained by calling the water plant at (419) 562-7951.

How to Read These Tables

The City of Bucyrus routinely monitors for contaminants in your water in accordance with applicable federal and state regulations. The tables on the following pages show the results of our monitoring for the period January 1 to December 31, 2017. For some contaminants the State of Ohio allows us to monitor on less than a yearly basis. For these contaminants the data presented is from the most recent testing done in compliance with the regulations and the date the testing was completed is noted in the tables.

For most contaminants the EPA has set in place MCLs. After extensive tests & study, these MCLs are set at very stringent levels. Comparing the level of a contaminant detected in our water (column 3 in the table) with its corresponding MCL (column 2), you will note that our water exceeds federal and state requirements.

Substances That May Be Present in Drinking Water

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity.

Contaminants that may be present in source water include: (A) Microbial contaminants, such as viruses and bacteria, which may come from sewage plants, septic tanks, agricultural livestock operations, and wildlife; (B) Inorganic contaminants, such as salts and metals, which can be naturally occurring or result from urban storm water runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming; (C) Pesticides and herbicides, which may come from a variety of sources such as agriculture, urban storm water runoff, and residential uses; (D) Organic chemical contaminants, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations, urban storm water runoff, and septic systems; (E) Radioactive contaminants, which can be naturally occurring or be the result of oil and gas production and mining activities.

In order to ensure that tap water is safe to drink, EPA prescribes regulations which limit the amount of certain contaminants in water provided by public water systems. FDA regulations establish limits for contaminants in bottled water which must provide the same protection for public health.

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants, although the presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's Safe Drinking Water Hotline (800-426-4791).

Special Health Information

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek the advice of their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and other microbial contaminants are available from the Safe Drinking Water Hotline.

How Do I Learn More ?

Water treatment has become an increasingly challenging and complex technology. It is our belief that a well-informed consumer is our best ally in supporting our efforts to upgrade and improve our system and to ensure the highest possible standards in our water. If you should have questions concerning this report, please contact the Chief Operator, Chad Slagle at (419) 562-7951. Issues affecting water quality may be addressed at regularly scheduled meetings of Bucyrus City Council, which are held the first and third Tuesday of every month at Bucyrus City Hall, 500 S. Sandusky Ave.

Table of Detected Contaminants

Contaminants (units)	MCLG	MCL	Level Found	Range of Detection	Violation	Year of Sample	Typical Source of Contaminants
Microbiological Contaminants							
Turbidity (NTU)	NA	TT	13.3	.02-13.3	YES	2017	Soil runoff.
Turbidity (% meeting Standard)	NA	TT	99.9	99.9-100	NO	2017	
TOC compliance ratio	NA	TT	2.1	1.9-3.3	NO	2017	Naturally present in the environment.
Inorganic Contaminants							
Barium (ppm)	2	2	.16	NA	NO	2017	Discharge from drilling wastes and refineries. Erosion of natural deposits.
Lead (ppb) ¹	0	AL = 15	<2.0	NA	NO	2017	Corrosion of household plumbing systems.
Zero out of 30 samples was found to have lead levels in excess of the lead action level of 15 ppb.							
Copper (ppm)	1.3	AL = 1.3	.018	NA	NO	2017	Corrosion of household plumbing systems.
Zero out of 30 samples was found to have copper levels in excess of the copper action level of 1.3 ppm.							
Nitrate (ppm)	10	10	1.15	.14-1.15	NO	2017	Runoff from fertilizer use. Leaching of septic tanks. Erosion of natural deposits.
Fluoride (ppm)	4	4	1.06	.62-1.30	NO	2017	Erosion of natural deposits. Water additive which promotes strong teeth.
Disinfection ByProducts							
Total Trihalomethanes TTHMs (ppb)	0	80	73.7	30.0-79.9	NO	2017	By-product of drinking water chlorination.
Haloacetic Acids HAA5s (ppb)	NA	60	23.9	8.5-31.7	NO	2017	By-product of drinking water chlorination.
Residual Disinfectants							
Total Chlorine (ppm)	MRDL= 4	MRDL = 4	1.5	1.3-1.7	NO	2017	Water additive to control microbes.

¹ If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. The City of Bucyrus public water system is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at <http://www.epa.gov/safewater/lead>.

Definitions of terms used in this report:

Turbidity	A measure of the cloudiness in water. We measure it because it is a good indicator of the effectiveness of our filtration system. The turbidity limit set by the EPA is 0.3 NTU in 95% of daily samples and shall not exceed 1.0 NTU at any time.
MCL	Maximum Contaminant Level: The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to MCLGs as feasible using the best available technology.
MCLG	Maximum Contaminant Level Goal: The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.
MRDL	Maximum Residual Disinfectant Level: The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.
MRDLG	Maximum Residual Disinfectant Level Goal: The level of drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.
TOC	Total Organic Carbon: The value reported under “Level found” for Total Organic Carbon (TOC) is the lowest ratio between the percentage of TOC actually removed to the percentage of TOC required to be removed. A value of greater than one (1) indicates that the water is in compliance with TOC removal requirements. A value of less than one (1) indicates a violation of the TOC removal requirements.
AL	Action Level: The concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.
TT	Treatment Technique: A required process intended to reduce the level of a contaminant in drinking water.
NTU	Nephelometric Turbidity Unit: A measure of the clarity of water.
NA	Not applicable.
ppm	Parts per million. One part per million corresponds to one penny in one million.
ppb	Parts per billion. One part per billion corresponds to one penny in one billion.
BDL	Below Detectable Levels
<	Symbol for less than.

DRINKING WATER NOTICE

Reporting requirements were not met for the City of Bucyrus Public Water System

Reporting requirements were not met for the City of Bucyrus PWS during June 2017.

The June 2017 source water sample for turbidity was not reported by the deadline as established by rule.

We are required to collect these samples to determine if additional treatment of our source water is necessary. Although this incident was not an emergency, as our customers, you have a right to know what happened and what we did to correct this situation.

What Should I Do?

- There is nothing you need to do at this time. You do not need to boil your water or take other corrective action.

What is being done?

Upon being notified of this violation, the water supply was directed to report the turbidity value for the June 2017 source water sample. The water supplier will take steps to ensure that adequate reporting will be performed in the future.

For more information, please contact Chad Slagle at 419-562-7951 or at 500 S. Sandusky Ave. Bucyrus, OH 44820.

Please share this information with all the other people who drink this water, especially those who may not have received this notice directly (for example, people in apartments, nursing homes, schools and businesses). You can do this by posting this notice in a public place or distributing copies by hand or mail.

PWS ID: OH1700011
